

Stony Point High School_IB Diploma Programme

2023-24 Course Syllabus

IB-SL Physics

Ms. Esther Jeong

Room number: B258

Teacher Contact: esther_jeong@roundrockisd.org

Tutorial Hours: Mon-Fri 8:30-9:00 AM

I. **Course Description:** Physics II (IB), 4346 & 4342(TAG)

This course includes selected topics in mechanics, thermal physics, oscillations and waves, electric currents, fields and forces, atomic and nuclear physics, and energy/power/climate change.

Credit: 1

Type: IB

Grade: 12

II. **Prior Learning for Course:** Credit in/or concurrent enrollment in Precalculus, #3609. All Diploma Programme physics students should be able to:

- perform the basic arithmetic functions: addition, subtraction, multiplication and division
- carry out calculations involving means, decimals, fractions, percentages, ratios, approximations and reciprocals
- carry out manipulations with trigonometric functions
- carry out manipulations with logarithmic and exponential functions (HL only)
- use standard notation (for example, 3.6×10^6)
- use direct and inverse proportion
- solve simple algebraic equations
- solve linear simultaneous equations

III. **Course Aims & Objectives:**

Through studying biology, chemistry or physics, students should become aware of how scientists work and communicate with each other. While the scientific method may take on a wide variety of forms, it is the emphasis on a practical approach through experimental work that characterizes these subjects. The aims enable students, through the overarching theme of the Nature of science, to:

1. appreciate scientific study and creativity within a global context through stimulating and challenging opportunities
2. acquire a body of knowledge, methods and techniques that characterize science and technology
3. apply and use a body of knowledge, methods and techniques that characterize science and technology
4. develop an ability to analyse, evaluate and synthesize scientific information
5. develop a critical awareness of the need for, and the value of, effective collaboration and communication during scientific activities
6. develop experimental and investigative scientific skills including the use of current technologies
7. develop and apply 21st-century communication skills in the study of science
8. become critically aware, as global citizens, of the ethical implications of using science and technology
9. develop an appreciation of the possibilities and limitations of science and technology
10. develop an understanding of the relationships between scientific disciplines and their influence on other areas of knowledge.

The assessment objectives for biology, chemistry and physics reflect those parts of the aims that will be formally assessed either internally or externally. These assessments will centre upon the nature of science. It is the intention of these courses that students are able to fulfill the following assessment objectives:

1. Demonstrate knowledge and understanding of:
 - a. facts, concepts and terminology
 - b. methodologies and techniques
 - c. communicating scientific information.
2. Apply:
 - a. facts, concepts and terminology
 - b. methodologies and techniques
 - c. methods of communicating scientific information.
3. Formulate, analyse and evaluate:
 - a. hypotheses, research questions and predictions
 - b. methodologies and techniques
 - c. primary and secondary data
 - d. scientific explanations.
4. Demonstrate the appropriate research, experimental, and personal skills necessary to carry out insightful and ethical investigations.

IV. How the course will address TOK:

The theory of knowledge (TOK) course (first assessment 2015) engages students in reflection on the nature of knowledge and on how we know what we claim to know. The course identifies eight ways of knowing: reason, emotion, language, sense perception, intuition, imagination, faith and memory. Students explore these means of producing knowledge within the context of various areas of knowledge: the natural sciences, the social sciences, the arts, ethics, history, mathematics, religious knowledge systems and indigenous knowledge systems. The course also requires students to make comparisons between the different areas of knowledge, reflecting on how knowledge is arrived at in the various disciplines, what the disciplines have in common, and the differences between them.

TOK lessons can support students in their study of science, just as the study of science can support students in their TOK course. TOK provides a space for students to engage in stimulating wider discussions about questions such as what it means for a discipline to be a science, or whether there should be ethical constraints on the pursuit of scientific knowledge. It also provides an opportunity for students to reflect on the methodologies of science, and how these compare to the methodologies of other areas of knowledge. It is now widely accepted that there is no one scientific method, in the strict Popperian sense. Instead, the sciences utilize a variety of approaches in order to produce explanations for the behaviour of the natural world. The different scientific disciplines share a common focus on utilizing inductive and deductive reasoning, on the importance of evidence, and so on. Students are encouraged to compare and contrast these methods with the methods found in, for example, the arts or in history. In this way there are rich opportunities for students to make links between their science and TOK courses. One way in which science teachers can help students to make these links to TOK is by drawing students' attention to knowledge questions that arise from their subject content. Knowledge questions are open-ended questions about knowledge such as:

- How do we distinguish science from pseudoscience?
- When performing experiments, what is the relationship between a scientist's expectation and their perception?
- How does scientific knowledge progress?
- What is the role of imagination and intuition in the sciences?

- What are the similarities and differences in methods in the natural sciences and the human sciences?

Examples of relevant knowledge questions are provided throughout this guide within the sub-topics in the syllabus content. Teachers can also find suggestions of interesting knowledge questions for discussion in the “Areas of knowledge” and “Knowledge frameworks” sections of the TOK guide. Students should be encouraged to raise and discuss such knowledge questions in both their science and TOK classes.

V. How the course will address CAS:

Creativity, activity & service (CAS) is at the heart of the Diploma Programme. It is one of the three essential elements in every student’s Diploma Programme experience. It involves students in a range of activities alongside their academic studies throughout the Diploma Programme. Examples of CAS opportunities in Physics can be the field trip to Teco-Westinghouse facility, helping other students to understand physics concepts, or realization of physics concepts in everyday life experience.

VI. How the course will address Approaches to Learning skills

Both SL and HL Physics courses are developed around the ATL principles set forth by the IB. ATL are as follows:

Thinking skills – students will explore the world around us and compare the physics concepts they learn with everyday life experience.

Communication skills – students will communicate with one another to discuss their understanding in the physics concepts and express their opinions/ideas both verbally and through written form.

Social skills – Students will interact with each other every class period through discussion, group projects, hands-on activities, collaborative work, and peer review.

Self-management skills – Students will learn to manage their time and resources with multiple subjects and extracurricular activities. They will be responsible for their own learning.

Research skills – Students will participate in a variety of scientific investigations, building their inquiry skills. Students will use these skills to complete IA for Physics.

VII. The approach to teaching the course.

There are variety of approaches to the teaching of physics. By its very nature, physics lends itself to an experimental approach, and it is expected that this will be reflected throughout the course. In each 90 minutes class, the course will be designed to have class lectures, class discussions, demonstrations, hands-on labs, working problems, and formative assessments.

By providing students with the opportunity for hands-on experimentation, they are carrying out some of the same processes that scientists undertake. Experimentation allows students to experience the nature of scientific thought and investigation. All scientific theories and laws begin with observations. It is important that students are involved in an inquiry-based practical programme that allows for the development of scientific inquiry. It is not enough for students just to be able to follow directions and to simply replicate a given experimental procedure; they must be provided with the opportunities for genuine inquiry. Developing scientific inquiry skills will give students the ability to construct an explanation based on reliable evidence and logical reasoning. Once developed, these higher order thinking skills will enable students to be lifelong learners and scientifically literate. Also, Students are expected to work collaboratively with others during lab and discussion sessions. Formative assessments include problems from old IB tests to prepare for external assessment.

VIII. How the course will address the Learner Profile.

The physics course contributes to the development of the IB learner profile. For example, the requirements of the internal assessment provide opportunities for students to develop every aspect of the profile.

Learner profile attribute	Biology, Chemistry and Physics
Inquirers	Aims 2 and 6 Practical work and internal assessment
Knowledgeable	Aims 1 and 10, international-mindedness links Practical work and internal assessment
Thinkers	Aims 3 and 4, theory of knowledge links Practical work and internal assessment
Communicators	Aims 5 and 7, external assessment Practical work and internal assessment, the group 4 project
Principled	Aims 8 and 9 Practical work and internal assessment, ethical behaviour/practice(<i>Ethical practice poster, Animal experimentation policy</i>), academic honesty
Open-minded	Aims 8 and 9, international-mindedness links Practical work and internal assessment, the group 4 project
Caring	Aims 8 and 9 Practical work and internal assessment, the group 4 project, ethical behaviour/practice(<i>Ethical practice poster, Animal experimentation policy</i>)
Risk-takers	Aims 1 and 6 Practical work and internal assessment, the group 4 project
Balanced	Aims 8 and 10 Practical work and internal assessment, the group 4 project and field work
Reflective	Aims 5 and 9 Practical work and internal assessment, the group 4 project

IX. Assessment details for Internal and External Requirements:

External Assessment Details (HL): weight 80%

Assessment Component (SL)	Duration	Weighting
Paper 1 (45 marks) Paper 1A – Multiple choice questions (25 marks) Paper 1B – Data-based questions (20 marks) No marks are deducted for incorrect answers	1.5 hr	36%
Paper 2 (50 marks) Short-answer and extended-response questions on standard level only.	1.5 hr	44%

Assessment Component (HL)	Duration	Weighting
Paper 1 (60 marks) Paper 1A – Multiple choice questions (40 marks) Paper 1B – Data-based questions (20 marks) No marks are deducted for incorrect answers	2 hr	36%
Paper 2 (90 marks) Short-answer and extended-response questions on standard level and additional higher level material.	2.5 hr	44%

Internal Assessment Details (HL): weight 20%

Purpose: Internal assessment is an integral part of the course and is compulsory for both SL and HL students. It enables students to internal assessment should, as far as possible, be woven into normal classroom teaching and no demonstrate the application of their skills and knowledge, and to pursue their personal interests, without the time limitations and other constraints that are associated with written examinations.

General Introduction: The individual investigation should cover a topic that is commensurate with the level of the course of study. Student work is internally assessed by the teacher and externally moderated by the IB. The performance in internal assessment at both SL and HL is marked against common assessment criteria, with a total mark out of 24.

The internal assessment task will be one scientific investigation taking about 10 hours and the write-up should be about 6 to 12 pages long. Investigations exceeding this length will be penalized in the communications criterion as lacking in conciseness.

The task produced should be complex and commensurate with the level of the course. It should require a purposeful research question and the scientific rationale for it.

Some of the possible tasks include:

- a hands-on laboratory investigation
- using a spreadsheet for analysis and modelling

- extracting data from a database and analysing it graphically
- producing a hybrid of spreadsheet/database work with a traditional hands-on investigation
- using a simulation, provided it is interactive and open-ended

Some task may consist of relevant and appropriate qualitative work combined with quantitative work. The tasks include the traditional hands-on practical investigations as in the previous course. The depth of treatment required for hands-on practical investigations is unchanged from the previous internal assessment and will be shown in detail in the teacher support materials. In addition, detailed assessment of specific aspects of hands-on practical work will be assessed in the written papers as detailed in the relevant topic(s) in the “Syllabus content” section of the guide.

Internal Assessment Criteria: The new assessment model uses five criteria to assess the final report of the individual investigation with the following raw marks and weightings assigned:

Criterion	Maximum number of marks available	Weighting (%)
Research design	6	25
Data analysis	6	25
Conclusion	6	25
Evaluation	6	25
Total	24	100

Levels of performance are described using multiple indicators per level. In many cases the indicators occur together in a specific level, but not always. Also, not all indicators are always present. This means that a candidate can demonstrate performances that fit into different levels.

- **Research Design:** This criterion assesses the extent to which the student effectively communicates the methodology (purpose and practice) used to address the research question.
- **Data Analysis:** This criterion assesses the extent to which the student’s report provides evidence that the student has recorded, processed and presented the data in ways that are relevant to the research question.
- **Conclusion:** This criterion assesses the extent to which the student successfully answers their research question with regard to their analysis and the accepted scientific context.
- **Evaluation:** This criterion assesses the extent to which the student’s report provides evidence of evaluation of the investigation methodology and has suggested improvements.

X. Grading Policy & Scale:

In IB-HL Physics, grades will be weighted as follows:

- Summative Assessments: 40 %
- Formative Assessments: 60 %

IB Physics class is weighted on a 6.0 scale. Summative assessments include tests and quizzes and Formative assessments include Lab Reports, Notes, Daily assignments, etc.

Teachers will be required to have one grade per week beginning the first full week of school. Teachers will update Home Access Center (HAC) weekly. Students are encouraged to check home access once a week in order to monitor their grades and progress. There will be at least 2 or 3 tests per marking period. The student has a responsibility to coordinate retakes and make-up work with his/her teacher.

XI. Course Sequence:

Syllabus Components	Teaching hours	
	SL	HL
Syllabus content	110	180
A. Space, time and motion	27	42
A1. Kinematics		
A2. Forces and momentum		
A3. Work, energy and power		
A4. Rigid body mechanics (HL only)		
A5. Galilean and special relativity (HL only)	24	32
B. The particulate nature of matter		
B1. Thermal energy transfers		
B2. Greenhouse effect		
B3. Gas laws		
B4. Thermodynamics (HL only)	17	29
B5. Current and Circuits		
C. Wave behavior		
C1. Simple harmonic motion		
C2. Wave model		
C3. Wave phenomena		
C4. Standing waves and resonance	19	38
C5. Doppler effect		
D. Fields		
D1. Gravitational fields		
D2. Electric and magnetic fields	23	39
D3. Motion in electromagnetic fields		
D4. Induction (HL only)		
E. Nuclear and quantum Physics		
E1. Structure of the atom		
E2. Quantum physics		
E3. Radioactive decay		
E4. Fission		
E5. Fusion and stars		
Experimental programme	40	60
Practical work	20	40
Collaborative sciences project	10	10
Scientific investigation	10	10
Total Teaching Hours	150	240

XII. IA Checkpoint dates and final IA Deadlines:

Failure to meet checkpoints will be communicated with the IB coordinator. All checkpoint submissions will be turned in electronically on the dates posted on Schoology, regardless of A/B schedule. Rough draft and final submission dates are recorded on the SPHS IA Calendar.

XIII. Sample Exam Questions:

Paper 1	<p>A skydiver of mass 80 kg falls vertically with a constant speed of 50 ms^{-1}. The upward force acting on the skydiver is approximately</p> <p>A. 0 N B. 80 N C. 800 N D. 4000 N</p>	<p>Answer: C</p> <p>When object is moving at a constant velocity, net force is zero. The forces acting on the skydiver is F_g and the upward force. Therefore, $F_g = F_{\text{upward}}$</p>
Paper 2	<p>State what is meant by an <i>ideal</i> gas. [2]</p>	<p>Gas that obeys the equation $pV=nRT$ / no forces between molecules (1pt); at all pressures, volumes and temperatures/or any other postulate (1pt);</p>
Paper 3	<p>A solid cylinder of mass M and radius R rolls without slipping down a uniform slope. The slope makes an angle θ to the horizontal.</p>  <p>The diagram shows the three forces acting on the cylinder. N is the normal reaction force and F is the frictional force between the cylinder and the slope.</p> <p>(a) State why F is the only force providing a torque about the axis of the cylinder. [1]</p>	<p>because Mg and N act through the axis OR only F has a non-zero lever arm «about the axis»</p>

XIV. Stony Point Academic Honesty Policy:

All students are expected to abide by the SPHS Academic Honesty Policy. This policy is available on the SPHS IB website at www.stonypointib.com under Handbooks. The password is Tiger2021.

Here are some guidelines to help students define cheating and plagiarism. Students should report any suspected violations to these policies immediately.

Cheating

Looking off another person's exam for answers

Collaborating with others on work that is supposed to be completed independently

Copying another student's homework, written assignments, examination answers, electronic media, or other data.

Assisting or allowing someone else to cheat.

Willfully copying or allowing class assignments to be copied and falsely presenting them as your own work and effort.

Using unauthorized materials such as books, notes, or "cheat" sheets to answer examination questions

Using or consulting electronic equipment including cell phones, PDA's, IPODS, etc. during a testing situation.

Being informed or informing, verbally or otherwise, of test questions or answers either during or prior to the testing situation.

Plagiarism

Representing the ideas, expressions, or materials of another without due credit.

Paraphrasing or condensing ideas from another person's work without proper citation.

Failing to document direct quotations and paraphrases with proper citation.

Submitting a paper purchased from a research or term paper service, including the Internet.

Undocumented Web source usage.

XV. Writing an Extended Essay in Science:

An extended essay (EE) in physics provides students with an opportunity to apply a range of skills while researching a topic of personal interest in the field of physics. A physics extended essay is characterized by a particular emphasis on physics within a more general set of scientific criteria. It should take the form of a research paper involving hypothesis or a model, or a critical analysis, that demonstrates argumentation, comparison, or the extraction of relevant information or data. Some topics may be unsuitable for investigation because of safety issues. For example, experiments involving dangerous or carcinogenic substances, radioactive materials, lasers, microwaves, UV light, noise or heavy equipment should be avoided unless adequate safety apparatus and qualified supervision are available.

Here are some examples of titles for physics extended essays (these are intended for guidance only):

Title	The deflection of starlight by the Sun's gravitational field
Research question	What will be the angular deflection of starlight by the Sun if Newton's Universal Law of Gravitation is applied?
Approach	A theoretical (numerical) approach is taken. Assuming a corpuscular model of light, the motion of these corpuscles moving at the speed of light in a gravitational field is followed by iteration. The results are compared to the one derived from general relativity.
Title	The efficiency of electromagnetic damping
Research question	Is the efficiency of electromagnetic damping of a moving glider a function of the initial kinetic energy of the glider?
Approach	An experimental approach is taken. The energy budget of a coil-carrying glider going through magnetic braking on a linear air track is followed by comparing the mechanical energy lost to the thermal energy generated in the coil.

Research methods include experimental, data-based, or theoretical. For data-based research, students may use SPHS library database.

XVI. Classroom Policy & Procedure:

Late Paper Policy: All work is due at the beginning of class. Late assignments will not be accepted after the 10th calendar day from when an assignment is due as specified in the gradebook. The maximum grade possible for late work is a 70.

Make Up Work Policy: Make up work will be accepted based upon student needs. All students can make up quizzes and tests by making corrections on each wrong question.

Classroom Expectations: All students will abide by the campus policies and procedures. Respect, integrity, and perseverance are expected within the classroom.
